**Abstract:** In this study, the surface of TiO<sub>2</sub> was coated with SiO<sub>2</sub> and Al<sub>2</sub>O<sub>3</sub> layers by sol-gel and chemical deposition methods. Firstly, the TiCl<sub>4</sub> was magnetically stirred for 1 h in deionized water, and then the NaOH solution was drop wised to the solution and stirred 2h. Finally, the obtained TiO<sub>2</sub> was washed, filtered, and dried in a vacuum oven. The surface of TiO<sub>2</sub> was coated with SiO<sub>2</sub> and Al<sub>2</sub>O<sub>3</sub> layers subsequently by chemical deposition methods. The morphological, thermal, and crystal properties of products were determined via SEM, TGA, and XRD machines. The X-ray diffraction peaks displayed that the TiO<sub>2</sub> nanoparticles were synthesized without any extra peaks. Moreover, the SiO<sub>2</sub> and Al<sub>2</sub>O<sub>3</sub> coated TiO<sub>2</sub> particles contain extra SiO<sub>2</sub> and Al<sub>2</sub>O<sub>3</sub> peaks, indicating that the surface of TiO<sub>2</sub> was coated via SiO<sub>2</sub> and Al<sub>2</sub>O<sub>3</sub>. The SEM results displayed that TiO<sub>2</sub> and SiO<sub>2</sub> and Al<sub>2</sub>O<sub>3</sub> coated TiO<sub>2</sub> were spherical in shape, and the size distribution was found to be around 20-50 nm and 200-300 nm, respectively. The photocatalytic and UV-vis analyses were used to determine the CO<sub>2</sub> reduction and optical properties of particles. The results showed that the absorption peaks were broad to longer wavelength with a coating of SiO<sub>2</sub> and Al<sub>2</sub>O<sub>3</sub>. The CO<sub>2</sub> reduction performance of TiO<sub>2</sub> has been enhanced via coating SiO<sub>2</sub> and Al<sub>2</sub>O<sub>3</sub> layer.

**Keywords:** photocatalytic; alumina; silica; TiO<sub>2</sub> nanoparticle.
