**Abstract:** As the new era of life is started the consumption of food also get increased and with these the waste of food is also increased and that's why this is being a new problem for those who don't have proper food to eat, but now the question is what can we do of waste food? Can we use it again in a proper manner and can we use it to do good for the environment, and the answer is recycling, we can use the waste food in the production of bioplastic, bioplastic is the new solution for the traditional plastic which is being a big problem for the environment because of its toxicity and bioplastic is a solution to improve environmental conditions. Bioplastic is the best solution to get over the use of traditional plastic and improve the condition of the environment.

**Keywords:** bioplastic; recycling; toxicity; traditional plastic; environment.
